

# **Apia monocrystalline solar module panels**

## Overview

---

Is a monocrystalline solar panel a photovoltaic module?

Yes, a monocrystalline solar panel is a photovoltaic module. Photovoltaic (PV) modules are made from semiconducting materials that convert sunlight into electrical energy. Monocrystalline solar panels are a type of photovoltaic module that use a single crystal high purity silicon cell to harness solar power.

How does a monocrystalline solar module work?

How Does Monocrystalline Solar Module Work?

The working of monocrystalline panels is quite simple and it starts as the sunlight hits the surface of the panel, the photons within the light interact with the silicon atoms in the solar cell which allow electrons to liberate from their atomic bonds.

How efficient are monocrystalline solar panels?

Monocrystalline panel efficiencies can range from 17% to 20%. Because monocrystalline solar cells are made out of a single crystal of silicon, electrons can flow easier through the cell, which makes the PV cell efficiency higher than other types of solar panels.

What are the different types of monocrystalline solar panels?

There are two main variations of monocrystalline solar panels: PERC and Bifacial. PERC (Passivated Emitter and Rear Cell): PERC monocrystalline solar panels are designed to increase the efficiency of the cells by reducing energy losses from the recombination of electrons.
