

China solar power with grid backup Buyer

Overview

What are the main issues with China's energy grid?

Heatwaves and industrial demand spikes have exposed weaknesses in China's grid, such as higher curtailment rates and ineffective transmission to areas of high energy demand in the east. This is partly due to rapid renewable deployment outpacing grid expansion.

How much solar power did China install in H1 2025?

In H1 2025, the world added 380 gigawatts (GW) of new solar capacity – a staggering 64% jump compared to the same period in 2024, when 232 GW came online. China was responsible for installing a massive 256 GW of that solar capacity. For context, it took until September last year to pass the 350 GW mark.

Are global solar installations breaking records again in 2025?

Global solar installations are breaking records again in 2025. In H1 2025, the world added 380 gigawatts (GW) of new solar capacity – a staggering 64% jump compared to the same period in 2024, when 232 GW came online. China was responsible for installing a massive 256 GW of that solar capacity.

Will China's energy investment slow in 2025?

While renewable installations are set to continue, investment growth is expected to slow in 2025. In the case of solar PV, investment is even expected to fall back slightly. China achieved its 2030 wind and solar capacity target in 2024, six years ahead of schedule. China's evolving macroeconomic priorities have long shaped its approach to energy investment.
