

# Detailed structure of roof solar panels

## Overview

---

What is solar panel roof mounting?

Solar panel roof mounting is the process of securely attaching photovoltaic panels to your home's roof structure using specialized mounting systems. This critical installation step determines both the safety and performance of your solar energy system for decades to come.

How do roof mounted PV solar panels work?

Roof mounted PV Solar Panels are typically supported by racking systems which come in two basic forms. The first is a mechanically fastened system and the second, the more common of the two, is a ballast restrained system. The mechanically fastened system penetrates through the roofing membrane and can be used in pitched roofs and flat roofs.

Do solar panels need a roof racking system?

Designers must design roofing systems for the structural impact of existing, new and future solar panel installations. Roof mounted PV Solar Panels are typically supported by racking systems which come in two basic forms. The first is a mechanically fastened system and the second, the more common of the two, is a ballast restrained system.

Can solar panels be installed on a sloped roof?

As well, solar panel installations on sloped roofs can act to trap snow that otherwise may have been considered to slide off the roof structure. Finally, roofing systems installed in new buildings are typically designed to outlast or at least match the average life of the new solar PV system which is about 25 years.
