

# **Geochemical chromium solar glass**

## Overview

---

Can glass be used as a mirror for concentrated solar power?

We then turn to glass and coated glass applications for thin-film photovoltaics, specifically transparent conductive coatings and the advantages of highly resistive transparent layers. Finally, we discuss the use of coated glasses as mirrors for concentrated solar power applications.

What is Solar Photovoltaic Glass?

This article explores the classification and applications of solar photovoltaic glass. Photovoltaic glass substrates used in solar cells typically include ultra-thin glass, surface-coated glass, and low-iron (extra-clear) glass.

Can glass improve solar energy transmission?

We begin with a discussion of glass requirements, specifically composition, that enable increased solar energy transmission, which is critical for solar applications. Next we discuss anti-reflective surface treatments of glass for further enhancement of solar energy transmission, primarily for crystalline silicon photovoltaics.

What type of mirror is used for concentrated solar power applications?

In summary, historically, most mirrors deployed for concentrated solar power applications have been of the second-surface variety; such mirrors employ low-Fe glass as the substrate/superstrate for silver-based coatings that are highly reflective to sunlight.
