

# **How high a temperature can a solar inverter withstand**

## Overview

---

How should a solar inverter cope with high temperature weather?

So how should the inverter cope with high temperature weather. How high temperature affects inverter's performance Efficiency Reduction: Solar inverters typically have a temperature derating curve, meaning their efficiency decreases as temperatures rise.

What is the optimal operating temperature for a solar inverter?

The optimal operating temperature for a solar inverter is typically within the range of 20°C to 25°C (68°F to 77°F). At this temperature range, the inverter's components can function efficiently without significant thermal stress or degradation. Maintaining the inverter within this range helps ensure optimal performance and longevity.

How hot does an inverter get?

It has an operating temperature range of -25°C to +60°C (-13°F to +140°F). In most cases, you would not need to worry about it getting so hot that your inverter stops working. To start, the hottest temperature ever recorded in the united states was 134°F in the Death Valley, which is below the 140°F range.

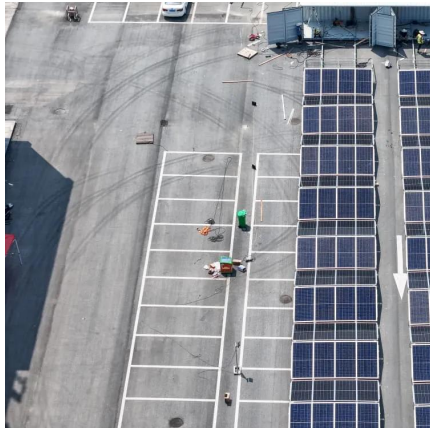

How does heat affect a solar inverter?

When temperatures rise, the efficiency of a solar inverter decreases. Semiconductor materials in the inverter's circuitry experience increased resistance as they heat up, leading to more energy being lost as heat rather than converted into electricity.
