

# Inverters with DC links belong to

## Overview

---

Why do inverters have a DC link capacitor?

In inverters the supply current is highly distorted due to commutation. The DC link capacitor acts as a filter to reduce the ripple in the DC link voltage and also as a DC link support so that for abrupt changes at the output we have a stabilized operation of inverter.

What is a DC link?

A DC link is a connection which connects a rectifier and an inverter. These links are found in converter circuits and in VFD circuits. The AC supply of a specific frequency is converted into DC. This DC, in turn, is converted into AC voltage. The DC link is the connection between these two circuits.

What is a DC link capacitor?

The AC supply of a specific frequency is converted into DC. This DC, in turn, is converted into AC voltage. The DC link is the connection between these two circuits. The DC link usually has a capacitor known as the DC link Capacitor. This capacitor is connected in parallel between the positive and the negative conductors.

What is a DC link circuit?

DC Link is a connection between a rectifier and an inverter. It acts as energy storage device between two stages. DC Link circuits are found in converter circuits or variable frequency drives (VFD).

## Inverters with DC links belong to

---

### What is a DC link

A DC link is a connection which connects a rectifier and an inverter. These links are found in converter circuits and in VFD circuits. The AC supply of a specific frequency is ...
