

Is there any impact if the battery cabinet and PLC are placed together

Overview

What is the purpose of a PLC battery?

(What is its Purpose) PLC configuration settings, Process set points, PLC logic, and Real-Time clock are stored in the EPROM (Erasable Programmable Read-Only Memory), and the battery powers the EPROM. The battery continues to power the EPROM, in case the PLC's power supply is isolated for maintenance or when a power failure occurs.

How to maintain a PLC control cabinet?

One tip is to front-mount the PLC and other key components, making them easier to access without removing parts of the cabinet. This will save time during maintenance or upgrades. Effective cooling and ventilation are essential to keep your PLC control cabinet running smoothly and avoid overheating.

Why does a PLC battery continue to power the EPROM?

The battery continues to power the EPROM, in case the PLC's power supply is isolated for maintenance or when a power failure occurs. The reason why the PLC battery is also referred to as CMOS battery, backup battery, RTC battery, processor battery, or the RAM memory battery.

What happens if a PLC battery dies?

At the same time, the internal batteries will be charged. As long as the power goes off, internal switching will take over and the power will now be supplied through the batteries. If the power resumes once again before the battery dies, the power supply will again be switched over through the mains supply. The same concept works for a PLC battery.

Is there any impact if the battery cabinet and PLC are placed together

[using batteries in PLC cabinet or UPS outside the cabinet](#)

Dears, for indoor located PLC cabinet, my preference is to use UPS for supplying the PLC cabinet, PLC cabinet is located indoor and the UPS will be located indoor. Batteries in ...
