

Moscow lithium power energy storage project

Overview

Will Russia speed up lithium production by 3-4 years?

Kolmozerskoye lithium deposit. (Image: Association of RM and REE) Russia plans to speed up its only lithium production project by 3-4 years from an originally planned 2030 to cut its dependence on imports and battery components, the CEO of the Polar Lithium joint venture said on Thursday.

Will Russia become the first country to produce lithium ion batteries?

It aims to become Russia's first-ever domestic producer of lithium-bearing raw materials and eventually build full local production of lithium-ion batteries. The project was originally expected to reach full annual production capacity of 45,000 metric tons of lithium carbonate and hydroxide by 2030.

When will polar lithium start production?

Subject to shareholder approval later this month, Polar Lithium aims to speed up development of the deposit and launch the first stage of production – in the pilot mode and at 10% of total planned capacity – in 2026-2027, Demidov said.

Why did Lithium prices fall in 2023?

Global prices for lithium, a key raw material in electric car batteries, slumped in 2023 due to electric vehicles sales lagging expectations and surplus supply, but this did not change Russia's appetite for its own production in the future.
