

# **PLC system uninterruptible power supply**

## Overview

---

What is a ups in a PLC?

A UPS ensures continuous operation of PLCs by providing a seamless transition to backup power during power outages or disturbances. The UPS can be used for two purposes. Feeding the power supply of the PLC or feeding the power supply for the control circuits that are wired to the I/O cards of the PLC.

What are uninterruptible power supplies (UPS)?

Uninterruptible Power Supplies (UPS) come into play as a safeguard against power disruptions that could compromise the functionality and reliability of PLCs. What Is a PLC?

A Programmable Logic Controller (PLC) is an industrial computer specifically designed for controlling and automating manufacturing processes.

What is a dual UPS (uninterruptible power supply)?

To enhance power reliability, dual UPS (Uninterruptible Power Supply) configurations are commonly deployed. However, one key engineering decision is whether to operate these UPS systems in split (independent) mode or parallel (synchronized) mode.

Why is uninterrupted power supply important in industrial automation & process control systems?

In modern industrial automation and process control systems, ensuring uninterrupted power supply is critical, especially for sensitive instrumentation such as Distributed Control Systems (DCS), Safety Instrumented Systems (SIS), and Programmable Logic Controllers (PLC).

DIN-rail/panel/floor mount  
Hard-wired input and output  
Integrated remote on/of and Dry I/O contacts  
USB communicationso  
Meet code requirements to allow proper shutdown of the UPS when control panel is open and closed and provide for remote monitoring and control of UPS.
