Series and parallel connection of lead-acid batteries for base stations

Overview

What is the difference between a series and parallel battery?

Series Connection: In a battery in series, cells are connected end-to-end, increasing the total voltage. **Parallel Connection:** In parallel batteries, all positive terminals are connected together, and all negative terminals are connected together, keeping the voltage the same but increasing the total current.

What types of batteries can be connected in parallel?

Flow batteries and other chemistries. These are commonly available in 48V. Multiple batteries can connect in parallel without any issues. Each battery has its own battery management system. Together they will generate a total state of charge value for the whole battery bank. A GX monitoring device is needed in the system.

Why are batteries connected in series?

batteries in Series. Increasing battery bank voltage. Batteries are connected in series when the goal is to increase the nominal voltage rating of one individual battery - by connecting it in series strings with at least one other individual battery of the same type and specification - to meet the operating voltage of the system.

How to connect batteries in parallel?

Connecting batteries in Parallel is normally performed to increase capacity. This can be done by connecting the positive terminal of the first battery to the positive terminal of the second battery. Likewise, the negative terminal of the first battery is connected to the negative terminal of the second battery.
