

Single-phase NPC inverter

Overview

What is a five-level inverter based on NPC and switched-capacitor technology?

Abstract: A novel five-level inverter based on neutral point clamped (NPC) and switched-capacitor technology is proposed in this article. The proposed inverter uses six unidirectional switches, two bidirectional switches, and three capacitors. The inverter has voltage-boosting capability, allowing it to increase the voltage by a gain factor of 1.5.

What are the different types of NPC inverters?

NPC inverters can be found on the market together with a flying-capacitor and other topologies, mostly in three levels. They can all be attractive to customers because of their indicators. The four-level inverters, such as the flying capacitor, have been analysed in research literature for many years.

Which type of inverter is best for photovoltaic power generation?

Single-phase H-bridge cascaded neutral point clamped (CHB-NPC) inverter is a popular choice for photovoltaic power generation, high power motor drive, and static reactive power compensators due to its high voltage withstand capability, low cascaded unit DC power requirement, and high efficiency and reliability [4, 5, 6].

Are single-phase multilevel inverters a good choice?

An experimental platform is established to verify the correctness and superiority of the method. With the continuous progress of power electronics technology, single-phase multilevel inverters have been widely used in a variety of applications, and have significant advantages over two-level inverters .
