

Solar air conditioning for sloping attic

Overview

What is a solar attic fan?

A solar attic fan is a roof-mounted ventilation fan powered entirely by the sun. It actively pulls hot air out of your attic, reducing heat buildup and moisture using free solar energy (no wiring or electricity required). Key benefits: Solar attic fans can lower attic temperatures by 20-50°F, easing the load on your A/C.

Is a solar attic fan a replacement for air conditioning?

No, it's not a replacement for air conditioning – but it assists your AC. Think of a solar attic fan as a passive helper to reduce heat gain, not an active cooler for your living space. It can dramatically lower attic temperatures, which in turn lessens the heat that sneaks into your home. This means your air conditioner has a lighter load.

Can a solar fan lower your attic temperature?

By expelling hot air, a solar fan can lower your attic temperature by tens of degrees. This prevents that heat from radiating down into your living space. Homeowners often notice that upstairs rooms feel cooler and AC doesn't have to work as hard.

Are solar roof vents a good option for attic ventilation?

As home owners resort to being more energy efficient and environment friendly, the popularity of attic ventilation through solar roof vents has experienced an increase. Not only do these solar systems regulate temperatures in attics but they also help in the saving of energy by reducing the intake of air during warmer months.
