

Solar container battery charging IC

Overview

How does a solar panel Charger IC work?

When full sunlight is available from the solar panel, the charger IC regulates the max charge current and battery voltage as desired. However, if the IC detects a voltage drop on the panel due to reduced sunlight, it reduces the charge current accordingly to prevent the input voltage from collapsing further.

How to charge a 12V battery with a solar panel?

Here we talk about a simple solar charger circuit. It takes power from a 20V, 1A solar panel and then charges a 12V battery. We are using a 7812 voltage regulator IC, three 1N4007 diodes, and a 2.2kΩ resistor to make sure the charging happens safely. Now let's go step by step. First our solar panel gives us 20V DC at 1A when the sun is bright.

What makes a good solar charge controller?

Solar charge controller designs often require: Accurate measurement of voltage, current and temperature. Compatibility with various solar panels and battery types. High efficiency and power density. Find products and reference designs for your system.

How does a solar charge controller work?

The implemented circuit consists of a 60 W photovoltaic (PV) module, a buck converter with an MPPT controller, and a 13.5V-48Ah battery. The performance of the solar charge controller is increased by operating the PV module at the maximum power point (MPP) using a modified incremental conductance (IC) MPPT algorithm.
