

Solar power solar inverter

Overview

What type of solar inverter do I Need?

The type of solar inverter you get installed at your house will be determined by several factors. To guide your solar design decisions, the four key solar power inverter technologies to know are string inverters, microinverters, power optimizers, and hybrid inverters.

What is a solar inverter?

A solar inverter, or solar panel inverter, is a device that converts the direct current (DC) output of solar panels into alternating current (AC). Our homes and the electrical grid use AC power, so the inverter is essential for integrating solar energy into our daily use.

What are the different types of solar inverters?

Different types of inverters serve various needs and setups. Let's explore the main types available. String inverters connect a series of solar panels, or a 'string,' to one inverter. The inverter then converts the combined DC power from these panels into AC power. String inverters are popular due to their cost-effectiveness and simplicity.

How does a solar inverter work?

The solar inverter's primary job is to take the raw DC electricity from your solar panels and convert it into the stable, usable AC electricity that powers your life. Without an inverter, the energy generated by your solar panels would be completely useless for your home.
