# **Spanish grid-connected solar panels**

## Overview

---

Why is grid-connected PV important in Spain?

- Dominance of Grid-Connected PV: The importance of grid-connected PV in Spain is significantly greater than that of self-consumption PV. This is reflected in the higher installed capacity in 2023, the larger cumulative capacity, and its key role in Spain's strategic energy plans—standing out compared to other European countries.

Is solar power a good investment in Spain?

Since he took power in 2018, energy developers have built solar parks, proved that power generation had attractive returns and pulled in capital from yield-hungry investors. In 2023 and 2024, Spain added more solar power capacity than any other European country except Germany, whose economy is more than twice its size.

How much solar power does Spain have?

Today Spain has 36GW of total solar capacity and the government's target is to reach 76GW by 2030. Spain has limited options for the surplus energy on its hands. Exporting large volumes to the rest of Europe is unfeasible because its grid links to France are limited. So the solution to the glut is storage.

How is Spain adapting to new solar regulations?

Spain's solar energy sector is adapting to new regulations designed to streamline project development and boost solar power adoption. A revised policy has replaced the former Feed-in-Tariff (FiT) scheme in Spain, creating a transition period for solar producers.
