

Thermal insulation effect of solar glass

Overview

What is heat insulation solar glass (HISG)?

Heat insulation solar glass (HISG) is a type of multifunction PV module. HISG has a considerably low shading coefficient and U value. HISG can reduce air conditioning and heating energy consumption in buildings. HISG can replace any type of glass installed in a building. HISG is a safe construction material.

How does energy saving glazing work?

Heat always flows towards the cold. Therefore, window glass without a low-e coating will absorb the heat from your home and radiate it onto the colder outside surface, where it is lost. Low-e glass has a special coating which is a poor radiator of heat and does not allow heat to be transferred to the outside.

How does glass prevent heat from getting out of a building?

Even the glass that was heated by the energy passing through it emits long wave energy and it can send it in two directions. Some is sent back out into the atmosphere and some to the inside of the building. The result is a neutral appearance glass that lets energy in and helps prevent heat getting out.

Do two types of glass affect thermal environments in Taipei?

Aside from differences regarding the glass installed in the two houses, both houses exhibited identical condition. This study observed the effects that two types of glass had on thermal environments within buildings under climate conditions found in Taipei.

Thermal insulation effect of solar glass

[ENERGY EFFICIENCY RESEARCH OF HEAT INSULATION ...](#)

The thermal building insulation materials and solutions constitute one of the key fields. Recent studies pointed out that energy efficiency measures were the most cost-effective ones, ...
