

What are the three types of solar panels

Overview

What are the different types of solar panels?

Most homeowners save around \$50,000 over 25 years. The three main types of solar panels are monocrystalline, polycrystalline, and thin film. Monocrystalline solar panels are the most efficient. Polycrystalline solar panels can be the most cost-effective. Thin-film solar panels can be the best for DIY projects or RVs.

What are the different types of solar panels used in the UK?

There are three main types of solar panels used in the UK: monocrystalline, polycrystalline and thin-film. Each converts sunlight into electricity, but differences in materials and manufacturing mean they vary significantly in efficiency, lifespan and how much roof space they require.

What type of solar panel do I Need?

The type of solar panel you need depends on the type of system you want to install. For a traditional rooftop solar panel system, you'll usually want monocrystalline panels due to their high efficiency. If you have a big roof with a lot of space, you might choose polycrystalline panels to save money upfront.

What are thin-film solar panels made of?

Unlike monocrystalline and polycrystalline solar panels, thin-film panels can be made from multiple materials. The most prevalent type of thin-film solar panel is made from cadmium telluride (CdTe). To make this type of thin-film panel, manufacturers place a layer of CdTe between transparent conducting layers that help capture sunlight.
